

Tecnotitlan Vulnerability Management Procedure

Effective date: 2026-07-05

Purpose

Tecnotitlan maintains a practical vulnerability management process to reduce security risks in the ecommerce platform and connected services.

Procedure

- Review dependency warnings during builds and deployments.
- Apply operating system, framework, and package updates when appropriate.
- Prioritize vulnerabilities affecting authentication, authorization, payments, customer data, admin access, file uploads, and API integrations.
- Avoid exposing secrets in frontend builds, public repositories, logs, or screenshots.
- Use HTTPS for production services.
- Restrict database access by IP allowlist where supported.
- Review errors and logs after deployments.
- Patch confirmed high-risk issues as soon as practical.

Verification

Security fixes should be verified through local builds, production smoke tests, or provider logs depending on the affected component.
